The ADH enzymes catalyse the last stage of the metabolic pathway of tyrosine biosynthesis and are potential targets of herbicides. The present sequence is the coding sequence for prephenate dehydrogenase, which was used to illustrate the

                                                                                                                                                                                                                                                                                                           This invention describes a novel method for the preparation of fine chemicals by culturing organisms in which the shikimate pathway has been altered relative to the wild type. The method involves a construct containing a plastid transit peptide, a chorismate mutase and/or prephenate dehydrogenase, linked to at least one regulatory sequence for transcription or translation in plants. The method is used to produce chemicals, particularly Vitamins E or K and/or ubiquinone, useful e.g. as fat-soluble antioxidants (in feeds, pharmaceuticals and cosmetics), but also aromatic amino acids, salicylic or folic acid derivatives, but plants with increased Vitamin E contents have improved resistance to plants with increased Vitamin E contents have improved resistance to abiotic stress, e.g. frost and drought. Transgenic plants with an altered shikimate pathway are useful as foods, fodder and in preparation of processed foodstuffs. Transgenic plants with modified shikimate pathways and increased content of desired chemicals, particularly tocopherols and/or tocotrienols. This sequence encodes the Escherichia coli tyra (chorismate mutase prephenate dehydrogenase) protein used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cbs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US-10-089-514-6 (1-322) x AAL46032 (1-1238)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method of producing Vitamin E, CC involving modulating the synthesis of vitamin E by reducing decomposition of homogentisate (HG) by reducing the activity of homogentisate-1,2-CC dioxygenase (HGD), maleylacetoacetate-isomerase (MAAI) and/or (funarylacetoacetate-hydrolase (PAAH). The method is used to produce transgenic organisms that are useful in animal and human nutrition and CC for the isolation of vitamin E. Vitamin E is a fat-soluble antioxidant CC with a protective effect against cardiovascular disease and cancer, it also stimulates the immune system and may prevent generalised age-related degeneration. When used in animal feeds, it improves quality and companied the storability of meat and can also be used in cosmetics. Also antibodies raised against the 3 specified enzymes are useful in screening for specific inhibitors, potentially useful as growth regulators, e.g. cherbicides. The present sequence is the E coli TyrA gene, which encodes the bifunctional chorismatmutase/prephenatdehydrogenase enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 1238

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DB

Sequence 31, Application US/09724797

Patent No. 6733998

GENERAL INFORMATION:

APPLICANT: Jon S. THORSON

APPLICANT: Jon S. THORSON

TITLE OF INVENTION: MICROMONOSPORA ECHINOSPORA GENES

TITLE OF INVENTION: ENCODING FOR BIOSYNTHESIS OF

TITLE OF INVENTION: CALICHEAMICIN AND SELF-RESISTANCE

FILE REFERENCE: 2653-40

CURRENT APPLICATION NUMBER: US/09/724,797

CURRENT FILING DATE: 2000-11-28

CURRENT FILING DATE: 2000-11-28
PRIOR APPLICATION NUMBER: 60/111,325
PRIOR FILING DATE: 1998-12-07
NUMBER OF SEQ ID NOS: 95
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3935275 GCCGCTGTCGCCGGCCCGCCGTCGCCGCC 3935246
